

# FINMA Guidance 08/2024 ([link](#))

## Governance and risk management when using artificial intelligence (1/3)

| Topics  | Pillar 1: Governance  | Pillar 2: Inventory & risk classification   |
|---|---|---|
| FINMA's findings                                    | <ul style="list-style-type: none"> <li>Supervised institutions primarily focus on data protection risks and <b>not on model risks associated with AI</b>.</li> <li>The development of AI applications is often <b>decentralised</b>.</li> <li>In the case of externally purchased applications, it is sometimes <b>difficult to determine whether AI is included</b>.</li> </ul>  | <ul style="list-style-type: none"> <li>Some supervised institutions <b>defined AI narrowly</b></li> <li>Difficulty for some supervised institutions to ensure <b>the completeness of the inventory</b>.</li> <li><b>Lack of criteria</b> to identify AI applications that present a risk</li> </ul>                     |
| FINMA's expectations                                | <ul style="list-style-type: none"> <li>Centrally managed <b>inventory</b> for AI applications</li> <li><b>Responsibilities</b> and <b>accountabilities</b> (for the development and use phases) must be clearly defined.</li> <li>Setting up rules for model <b>testing</b>, documentation standards, and broad training measures</li> <li>In the case of outsourcing, contractual clauses governing <b>responsibilities and liability issues of the provider</b></li> </ul>  | <ul style="list-style-type: none"> <li>A <b>sufficiently broad</b> and <b>uniform definition</b> of AI</li> <li>Establishment of <b>criteria</b> to identify <b>significant AI applications</b> and <b>specific risks</b> requiring special attention</li> </ul>  |
| Concrete implementation (examples from OA practice) | <p>Implement an <b>internal directive</b> that allocates responsibilities (to avoid: projects managed solely by the first line or that emerge in a decentralised manner), <i>but important to note</i> what FINMA does not say: the authority does not prohibit decision-making through AI (however a "human" must assume ultimate responsibility) → acceptability of automated individual decisions (<a href="#">Art. 21</a> of the Swiss Data Protection Act)</p> <p>Understanding the services provided by third parties + <b>contractual commitments</b> to be obtained from third parties (even if the market is concentrated with a small number of providers) → similar issues as those arising in the context of outsourcing projects</p> | <p><b>Checklist</b> and <b>heat map</b> to document, for each use case, <b>(i) model risks</b> (robustness, correctness, bias, stability, and explainability) of AI and <b>(ii)</b>, where applicable, the contractual commitments made by third-party providers.</p> <p>Inventory with a risk-based classification</p> |

## Governance and risk management when using artificial intelligence (2/3)

| Topics  | Pillar 3: Data quality   | Pillar 4: Tests & ongoing monitoring   | Pillar 5: Documentation  |
|---|--|--|--|
| FINMA's findings                                    | <ul style="list-style-type: none"> <li>Not all supervised institutions have defined rules and processes to ensure <b>data quality</b> in AI applications.</li> </ul>   | <ul style="list-style-type: none"> <li>Weaknesses identified in the planning and implementation of <b>tests</b> and <b>controls</b></li> <li>Few <b>specific performance indicators</b> are defined in advance.</li> </ul>                     | <ul style="list-style-type: none"> <li>Some supervised institutions do not have <b>directives to document</b> the use of AI.</li> <li>Documentation which is incomplete, insufficiently detailed, and not tailored for the users of the application</li> </ul> |
| FINMA's expectations                                | <ul style="list-style-type: none"> <li>Establish <b>internal rules/directives</b> to ensure the completeness, correctness, integrity, and accessibility of the data used</li> </ul>  | <ul style="list-style-type: none"> <li>Implementation of <b>testing processes</b> to verify AI models, and to ensure that the applications achieve the intended objectives.</li> <li><b>Conducting regular checks</b> of AI outputs</li> </ul> | <ul style="list-style-type: none"> <li>Provide <b>detailed documentation for important applications</b> covering: the objectives of the application, its reliability, risks, data selection, and data quality.</li> </ul>                                      |
| Concrete implementation (examples from OA practice) | <p>Internal process for the quality control of the input data</p> <p>Implicit <b>scepticism</b> of the regulator towards the use of <b>LLMs</b> (due to the very practical difficulty of data quality control) → risk that the deployment of LLMs may be subject to regulatory limits in the future?</p> | <p>Definition of <b>KPIs</b>.</p> <p><i>Ex post</i> controls to address the phenomenon of model/data drift</p> <p>Audit process (if necessary, by a third-party expert)</p>  | <p>Documentation of the applications used: <b>(i)</b> purpose of the applications, <b>(ii)</b> selection and preparation of data, <b>(iii)</b> selection of models, <b>(iv)</b> KPIs, <b>(v)</b> tests and controls, and <b>(vi)</b> fallback solutions</p>    |

# FINMA Guidance 08/2024 ([link](#))

## Governance and risk management when using artificial intelligence (3/3)

| Topics  | Pillar 6: Explainability  | Pillar 7: Independent review  |
|---|---|---|
| FINMA's findings                                    | <ul style="list-style-type: none"> <li>The results of AI models are <b>often not explainable</b> and <b>not reproducible</b>, which limits the ability to conduct critical assessment.</li> </ul>   | <ul style="list-style-type: none"> <li><b>Independent verification</b> processes for the development of AI models are rarely implemented.</li> </ul>  |
| FINMA's expectations                                | <ul style="list-style-type: none"> <li>Ensure that the results of the models are <b>understandable</b> to stakeholders, whether they are for example investors, clients, or employees.</li> <li>Understand the mechanisms behind the models to ensure their plausibility and robustness.</li> </ul>   | <ul style="list-style-type: none"> <li>For material applications, implement an <b>independent review</b> covering the entire development cycle to obtain objective opinions and identify risks.</li> </ul>  |
| Concrete implementation (examples from OA practice) | <p><b>Due diligence</b> of AI applications → the (challenging!) goal should be the reproducibility of the output to be able to understand its origin / sensitivity analysis / indication of sources in <i>Retrieval Augmented Generation (RAG)</i> projects</p> <p>Also important for defending against third-party liability claims → "premonitory" case law: ATF <a href="#">4A_301/2023</a> (in the case of liquidation of a client's positions with a negative balance, the bank must prove these losses)</p> | <p><b>Functional separation</b> (Chinese walls?) between developers and those responsible for the review</p> <p>Involvement of third-party experts at both technical and legal levels, particularly for defining KPIs, output control, and audits</p> |
